## M12 Problem Set: Simple Linear Regression for TAs

## Pablo E. Gutiérrez-Fonseca

## 2024-03-28 11:01:25

We conducted an experiment to investigate the potential relationship between temperature variations and plant growth. We measured the height of specific plant species across a range of temperatures.

Perform a simple linear regression to explore this relationship. Use the variables: **loght and temp**.

- 1. What is the response variable?
- 2. What is the explanatory variable?
- 3. Since regressions can help model scenarios, determine the regression equation for the (log) plant height as a function of temperature.
- 4. Summarize: Write a concise one paragraph summary of this analysis. Remember that any summary should include the following:
- a. Statement of the research hypothesis or study objectives.
- b. Brief summary of methods (one sentence or less).
- c. Statement of the statistical results (including type of test and shorthand: R-squared= obtained value, p = 0.xxx).
- d. Description of any differences, if meaningful, along with an interpretation of why these results make sense (or don't make sense).
- #1. Import libraries and load packages

```
library(tidyverse)
library(dplyr)
library(readxl)
```

## #2. importing our data

```
Plant_height <- read.csv(file = "Plant_height.csv", header = TRUE)
head(Plant_height)</pre>
```
